Introduction

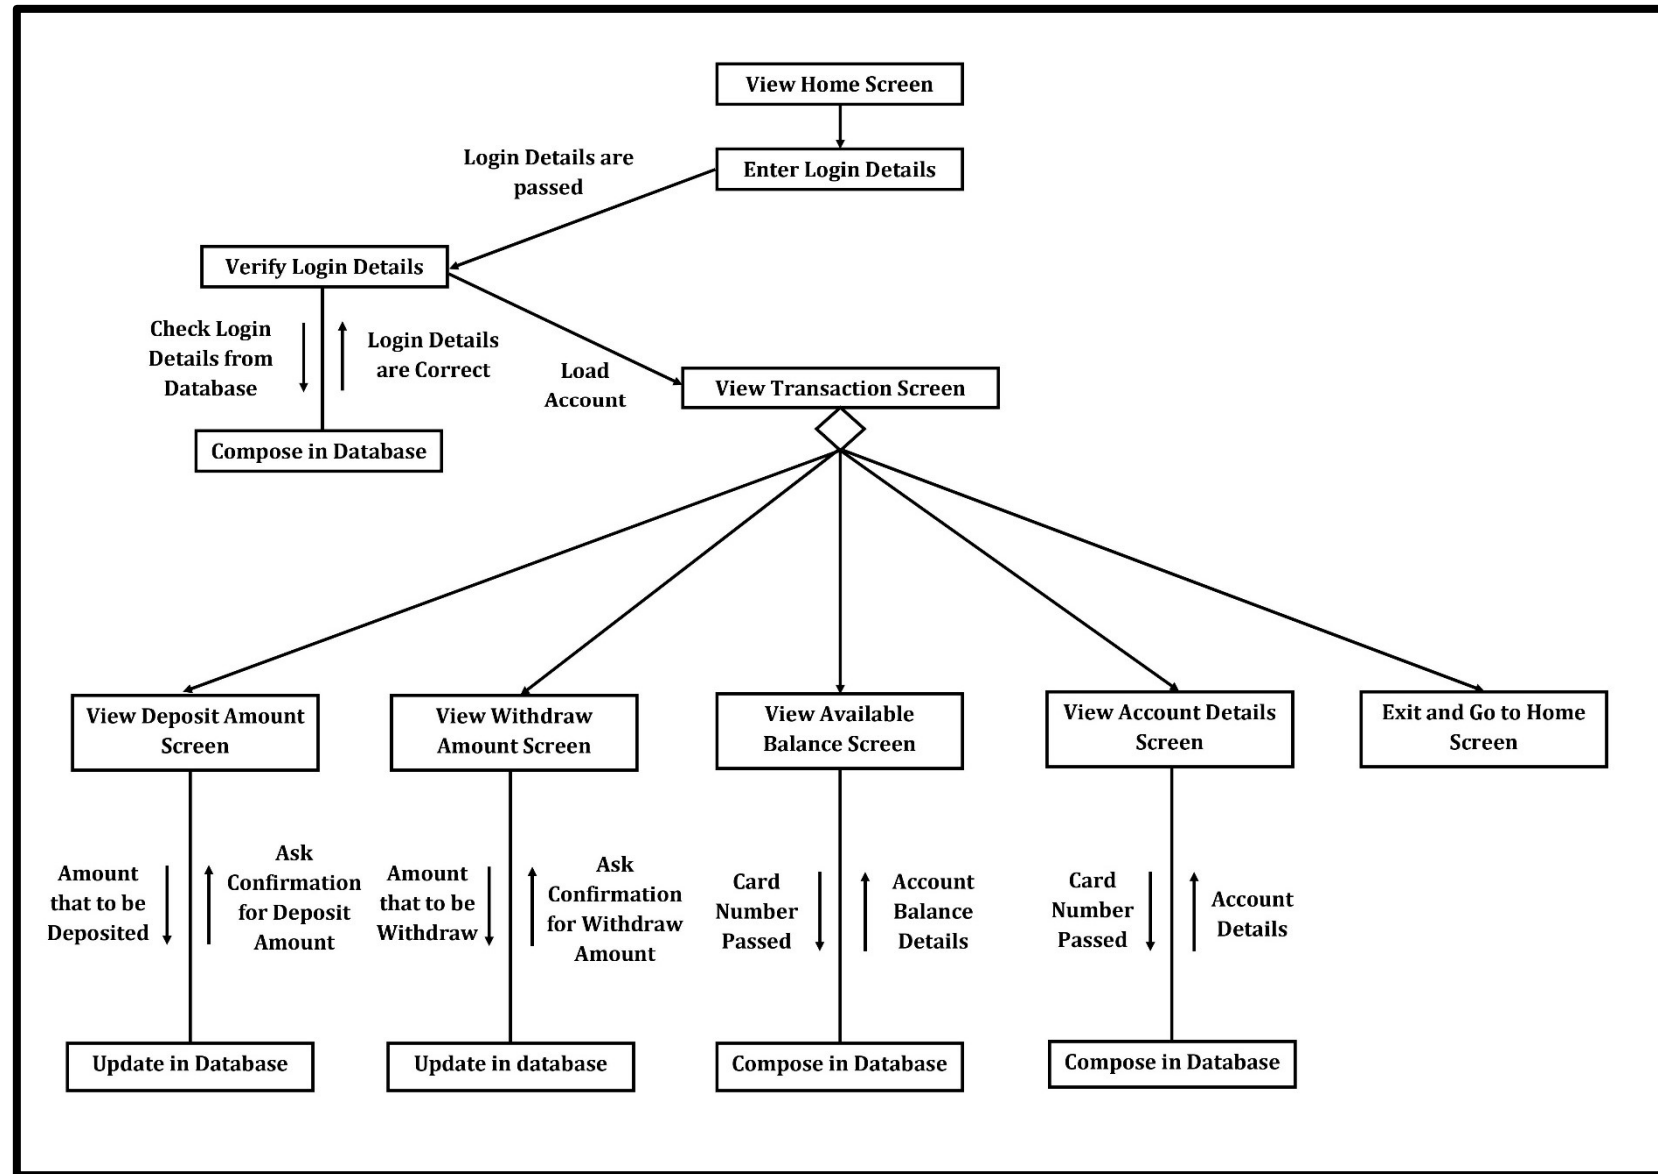

As we are growing as technical world, use of ATM cards and other payment services are grown in very short time everywhere but in the hustle and bustle of the city life we often tend to forget our wallets or card holder or sometimes we loose it. Also sometimes the other payment services are available or under maintenance which creates a terrible situation for the User.

Here we come up with an idea aims to solve this problem by adding up an another option for the Users for making a transaction (either deposit or withdraw). This project is also concerned about user account security and to help in an emergency situation.

Concepts of C used

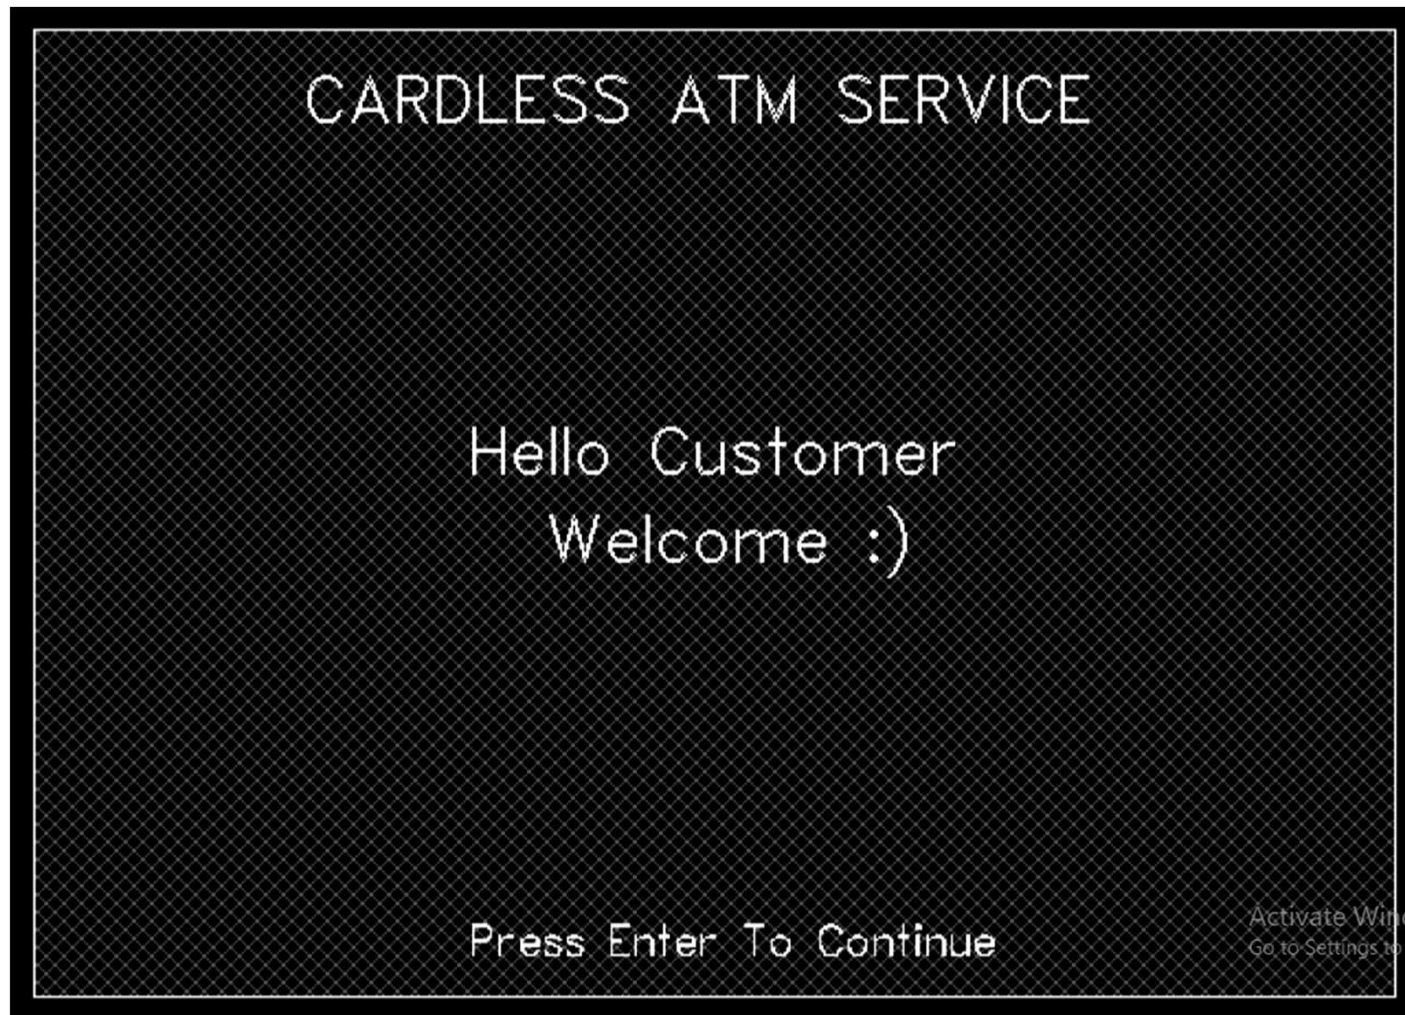

- File Handling
- Graphics
- Condition Statement
- Iteration Statement
- Structure
- Functions
- Global Variable

Structure Chart

MODULE I

- Interface through which User interact First (Home Screen)

of the Account
Details Screen.**

MODULE VIII

- Everytime when User complete its transaction successfully, it shows a screen displaying Thank You for few seconds and redirect to the Home screen.

CONCLUSION

Therefore, our project provides a way in which this problem can be solved. People will be able to perform transactions only for small amounts.

This way people will have to worry less about carrying ATM cards. This will reduce the time consumed in the process. There will be an added advantage in the form of transaction pin which is a option for double security.

Thank You
